

Deep technology. Ready for business. Responsible by design.

Batoi Platform

Governed digital and AI-assisted delivery

PLATFORM OVERVIEW

Late control fragments digital ambition

01

Strategy

Intent, users,
outcomes, risk

02

Delivery

Applications, APIs,
workflows, releases

03

Security

Findings,
dependencies,
release gates

04

Governance

Policy, approvals,
obligations, evidence

05

Operations

People, systems,
service, improvement

The cost is not only tool sprawl. It is broken accountability between decisions, actions, enforcement, and evidence.

One foundation connects delivery and control

Products, deployments, and extensions can evolve without splitting shared control.

Accountability spans supported workflows

Batoi Intelligence across supported workflows

B BUILD

Plan, create, integrate,
release, verify

G GOVERN

Policy, risk,
approvals, decisions

G GUARD

Findings, safeguards,
exceptions, review gates

L LEARN

Guided practice and
capability in context

SHARED PLATFORM FOUNDATION

Workspace and application context | identity and access | connected services

Decisions, safeguards, accountable evidence, and governed operation stay connected.

Four capabilities drive verified outcomes

01

Build

Applications, APIs,
workflows, releases

02

Govern

Policy, risk,
approvals, obligations

03

Guard

Security findings,
SBOM, supply chain

04

Learn

Guided Labs, readiness,
adoption, mastery

One accountable chain: decision → action → enforcement → evidence →
improvement

Core keeps context and evidence connected

CORE

The shared
workspace foundation
—not a separately
sold product.

Workspace • project •
application • asset •
environment

01

Identity and access

Named people, services, agents, roles, and entitlements

02

Knowledge and collaboration

Projects, Playbook, files, forms, messages, and shared views

03

Reporting and evidence

Activity, decisions, approvals, reports, compliance packs, and audit support

Shared context does not blur authority: each connected capability retains responsibility for its own decisions.

Governed delivery connects intent to proof

The GitHub repository remains the source of truth; deployment and database work stay bound to the selected app and environment.

Govern decides. Guard assesses. Build enforces.

Specialist responsibilities remain distinct; versioned decisions and evidence references keep the chain reviewable.

Intelligence assists. Learn builds practice.

Batoi Intelligence

Governed assistance and orchestration across supported workflows.

- ✓ Approved context and permissions
- ✓ Human review and decision authority
- ✓ Protected provenance and usage evidence

Batoi Learn

Guided Labs, assessment, reflection, mastery, and reviewed application.

Assistance does not inherit decision authority. Learning does not replace institutional Academy programs.

Three pillars keep governed systems coherent

Products and customer-built systems can evolve without splitting governance, auditability, or deployment discipline.

Deployment choice needs explicit ownership

BATOI-MANAGED

**Rapid adoption with Batoi
operating the managed
environment.**

PARTNER-MANAGED

**Partner delivery with defined
operational, assurance, and
support ownership.**

CUSTOMER-MANAGED

**Customer-controlled runtime
with verified contracts back
to the Platform.**

Define runtime • data • network • credentials • ingress • evidence • updates • incidents • support

Independent assurance strengthens trust

ISO 9001:2015	Certified quality management system	TÜV SÜD South Asia • valid through 15 Aug 2028*
ISO/IEC 27001:2022	Certified information security management system	TÜV SÜD South Asia • valid through 15 Aug 2028*
SOC 2 TYPE II	Independent examination—not a certification	Security • Availability • Processing Integrity • Confidentiality
GDPR	Independent assessment completed in 2025	Privacy obligations depend on role, processing context, location, and contract
HIPAA	External assessment and readiness work	For applicable services; supported by contractual and operational safeguards

*Subject to certificate, entity, service, system, period, and surveillance scope. Assurance does not automatically extend to every deployment or customer environment.

One accountable context serves every leader

ENTERPRISE LEADERS

Connect digital ambition to owned decisions, approved delivery, and reviewable outcomes.

ARCHITECTS & ENGINEERS

Build and integrate governed systems while preserving deployment choice.

SECURITY & RISK

Keep policy, findings, exceptions, approvals, and evidence connected to delivery.

CONSULTANT PARTNERS

Combine sector context and transformation leadership with Batoi architecture and enablement.

Start where accountability is most material—not where the feature list is longest.

Start with one material outcome

Frame the users, workflow, data, integrations, risks, and success measures. Then build a focused blueprint and bounded pilot.

01

QUALIFY

Confirm outcome and fit

02

BLUEPRINT

Define architecture and roles

03

PILOT

Validate the priority workflow
